

Appoint-o-Matic APP

Recently when I worked in many firms, I realised that many small businesses still uses excel as their primary tool and VBA as programming language of it. But Excel have its limitations and to grow in business we must evolve to advance tech. Python is one stop solution for that. I created this app in such a creative way that it integrates excel functionality with python and perform extra-excel tasks which excel can not do. Isn't it interesting that we can use UI in excel created by basic shapes and send data as an argument to python code and perform tasks like web scraping and Automation.

How to use This Repo:

- 1) Firstly, create a separate folder and copy all this repo in your system.
- 2) Open App Named Appoint-o-Matic and **enable macros**
- 3) In .exe path provide path of "main.exe" file.
- 4) Then give paths for appointment rule and processed appointments, also give output folder path where you want to have an output
- 5) If it shows macro disable then just copy paste app UI and VBA code to run python in your excel file and save as **macro enabled excel file**
- 6) Then just press execute
- 7) This is demo file where on my business logic I created this automation for your business req. we can do the same and perform so many tasks and create an app within minutes.
